Need to contact

us Visit. I am getting 2 or 3 calls a week. Also complaints on the 120 volt gas valve making a noise when closing. What have you found When they started it up and were running the combustion test the thing was roaring pretty good, they had to increase the air to 24% to quiet it down some. Its still roaring but not as bad if it was optimally tuned so its not as efficient as it could be. The O2 is 4.3%, CO2 9.4% and the stack is 433F with an ambient of 50F. http://specialteh.ru/uploads/bosch_over_the_range_microwave_manual.xml

The gas valve was noisy as well, sounded like someone was rapping on the pipe with a bat. Over the last few months the noise has gotten less and less, maybe the valve is wearing in Bob No valve noise, just roaring. The carlins have always been a little loud, the waynes are noticeably more quite. I havent heard the 120v gas valve or noticed a noise. Ill ask my tech, he swapped out a carlin ez1 for an ez gas about 3 weeks ago. Only a couple of noise complaints to my knowledge that I believe have been corrected. One whistle that was an undersized flex gas supply that should not have been used. We prefer Fuelmaster burners. Last year, we got stuck using two Carlin burners on Smith 8 Series, one on gas and one on oil. The gas one was very noisy. It required the replacement of the retention head of another design which Smith provided. That solved the noise issue. She rumbles a little more than it did with the ez1, no gas valve noise. The oil has lots of cast iron parts to muffle the noise is what I figure. Also tuning by way of a combustion analyzer is critical to keep the noise down. No gas valve noise complaints though. The fresh air intake cover helps with noise complaints if they exist after tuning. Ill have to contact Carlin to see if a different retention head would help control the noise on my G83 boiler. Is there a model number I should ask about Bob One of the nice things about the Midco radialflame lowNOx burner is that it doesnt produce any rumble at all. Still waiting for them to come up with a proper steam control system for it. I cant find anything about the 9S diffuser in any of the manuals. He was going to fire it about 150000btus. He didnt mark the orifice size. I have a feeling these noisy burners are not installed correctly and not set up properly. I like the Carlin. I feel it is a good burner. I also know some people are bothered by the noise and other burners are out of tune.

You need to tread lightly as some of the noise complaints will be valid and some will not be. If guys are just setting them by the manual without testing the combustion They are causing issues and making a bad name for a good burner. I had one in New Bedford That a guy with 30 years installing for the the gas company installed and it was out of tune and the orifice was 3 yes 3 drill sizes too small. I was called in because the house would not heat and they said it was the steam piping. Really an amazing difference. Maybe there is something here for the EZ as well After going back and forth with Jstar I found I could fire the boiler lower and in conversations with Carlin tech support they thought a lower rate of firing would quiet the beast down. Here are the numbers the guy got. The efficiency has gone from 80.5% detuned to quiet it down up to 84% and the noise level is about half what it was with the old setup. O2 is 3.2% and CO2 is 10% with a stack of 310F. This should reduce the short cycling I was experiencing by a lot. Maybe downfiring is the key to solving some of the noise complaints. My thanks to JSTAR for his input. Bob When I cut the firing rate by about 30% the rumbling all but disappeared. This only works if your EZGas powered boilers firing rate is high enough to justify the cut. Carlin should add a note in their manual so installers dont make this mistake. Bob Same as an oil burner, or even a little more pronounced in some boilers. The larger boilers, 4 sections and up, seem to have less of a rumble. Today we experimented a little to see what affects the noise. Here are some items that had no effect Tube insertion depth Gas pressure Length of first flue pipe off back of boiler Orientation of draft control; horizontal, vertical, closer, or further from boiler The rumble is certainly coming from the flame itself. Well be ordering some 9slot tubes and going back to install one on this job for further testing.

It would be interesting to somehow shorten the flame and see if that affects the rumbling. Have you noticed any correlation between the height of the chimney and the rumble Bob Probably inadequate

testing as usual. I know in a lab you cant duplicate all field problems but test, test, test!!!!!! Most of us would probably prefer American equipment if it is good equipment If you want to get involved, click one of these buttons. We have no relationship with advertisers, products, or services discussed at this website. We describe how to inspect, troubleshoot and repair heating and air conditioning systems to inform home owners, buyers, and home inspectors of common heating system defects. The nozzle face must be 46mm behind the inner face of the turbulator surface. For other models of oil burners and their adjustments see OIL BURNER MANUALS. Often that data is imprinted on a tag right on the oil burner itself. Our photos and illustrations show how a stainless steel oil burner nozzle and electrode adjustment gauge is used to align the oil burner electrodes, courtesy of Beckett Corporation, a supplier of oil burners including the model shown at the top of this page. We also discuss oil burner nozzles and heating oil delivery rates and pressures Early in our oil burner service experience we thought it was great to make these parts as tight as possible. T The result was damaged threads on the oil line to which the nozzle adapter was mounted, or damaged threads between the nozzle adapter and the nozzle itself leading to oil spray leaks, improper firing, and having to replace these parts damaged by heavy handedness. Many oil burners include a heat shield mounted on the end of the burner tube OR multibladed turbulator assembly, often held in place by a collar tightened over the oil burner nozzle. Shown above the combustion head assembly for a Carlin 201 oil burner excerpted from the manual cited below.

The turbulator holding bracket and its mounting position on the nozzle adapter may be fixed to assure good clearance distance ahead of the electrode tips. In that case the manufacturer wont specify an adjustment for the gap shown by the yellow lines in our illustration. The turbulator improves the oil dispersion in the combustion chamber. There will be a spacing specified between the turbulators inner face and the electrodes. Watch out if you set the turbulator too close to the electrodes an electrical arc between electrodes and turbulator will short the system and prevent proper ignition. Always check and clean oil and soot accumulated from the turbulator both to permit proper air and oil dispersion and to remove whiskers of soot that will short between the turbulator and the electrodes. Macmillan Publishing Co., NY Alan Carson is a past president of ASHI, the American Society of Home Inspectors. Carson Dunlop Associates provides extensive home inspection education and report writing material. The text is intended as a reference guide to help building owners operate and maintain their home effectively. Field inspection worksheets are included at the back of the volume.
